AMENDMENT TO THE CLAIMS

Claims 1-12. (Cancelled).

13. (Currently Amended). A kit for preparing an anatomical model of a

foot, comprising:

a sock structure carrying an activatable hardenable compound, said sock

structure and compound adapted to be conformed to a foot and to be activated to a

hardened sock structure; and

a flexible liner having a generally non-porous, moisture impervious surface,

the liner being vapor impervious and formed from a continuously cured elastomer, the

liner adapted to be conformed to a foot and to be positioned as an intermediate layer

between a foot and the sock structure.

14. (Previously Presented). The kit according to claim 13, wherein the

liner and sock structure are integrated into a unitary sock structure, the liner defining

an internal surface of the unitary sock structure with the non-porous surface of the

liner adjacent an internal surface of the sock structure.

15. (Previously Presented). The kit according to claim 13, further

comprising compliant core spacer elements configured to be positioned at

predetermined regions of a foot.

16. (Previously Presented). The kit according to claim 13, further comprising an inner stocking member suitable to protect skin from core spacers and elements of the sock and liner.

17. (Previously Presented). The kit according to claim 16, wherein the core spacer elements on the inner stocking correspond at least to toe and dorsal regions of a foot.

18. (Previously Presented). The kit according to claim 13, wherein the settable forming material comprises polyurethane.

- 19. (Previously Presented). The kit according to claim 13, wherein the sock structure comprises a glass fiber textile.
- 20. (Previously Presented). The kit according to claim 19, wherein the sock structure comprises elastomeric fibers woven into the glass fiber textile.
 - 21. (Cancelled).
 - 22. (Cancelled)
- 23. (Previously Presented) The kit according to claim 13, further comprising a pourable and settable last forming material suitable for forming a last when set and hardened.
- 24. (Currently Amended) A kit for preparing an anatomical model of a foot, comprising:

a sock structure formed of a woven material carrying an activatable

hardenable compound, the sock structure adapted to be activated to a hardened sock

structure; and

a flexible liner including an elasticized fabric and a non-porous, moisture

impervious continuously cured silicone elastomeric layer coating at least one surface

of the fabric, such that the liner is vapor impervious, and the liner is adapted to be-

conformed to a foot.

25. (Previously Presented) The kit according to claim 25, wherein the

liner is configured as a stocking adapted to be rollable onto a foot.
